

Fluoridation Hurts Kids

Story 1

This was caused by drinking water fluoridation at 1 ppm with hydrofluosilic acid. She was born in San Francisco and lived there until the first of her 6 sisters was born. The family then moved to a farm house that had its own well. She is an absolutely gorgeous girl who is trying to make her living as a model while going to the university. Her photographer told her that her career was limited unless she got those "headlights" fixed. None of her 6 sisters has any sign of dental fluorosis. She did not take prescription fluoride or use fluoridated toothpaste until 6 years of age.

Mild

Story 2

Moderate

This child was prescribed fluoride vitamin tablets by her pediatrician for the first three years of life 1980 to 1983 until I saw her mother as a new patient. I told her mother to stop giving her the fluoride. The child is grown now but you can see the damage fluoride did to the top 1/2 of the tooth in just 3 years. Imagine how ugly the tooth would be in a lifetime of exposure.

Story 3

My 18 year old son has fluorosis (mottling of his teeth) from drinking the water in the town where we lived when he was pre-born and then an infant and toddler. I have read that fluoride may cause people to have mouth ulcers, and I realized that my husband and I were constantly plagued with mouth ulcers while we lived in that town [where my son got the fluorosis].

We moved and lived for 12 years in another town that had fluoride, but less of it, and I realized that we still had mouth ulcers, just not as intensely. Since moving to a city which currently has no fluoride in the water (but will soon, thanks to a vote by the citizenry) we have not suffered mouth ulcers. - Jana Miller

Severe
